

## LM75x Digital Temperature Sensor and Thermal Watchdog With Two-Wire Interface

### 1 Features

- No External Components Required
- Shutdown Mode to Minimize Power Consumption
- Up to Eight LM75s Can be Connected to a Single Bus
- Power Up Defaults Permit Stand-alone Operation as Thermostat
- UL Recognized Component (LM75B and LM75C)
- Key Specifications:
  - Supply Voltage
    - LM75B, LM75C: 3 V to 5.5 V
  - Supply Current
    - Operating: 280  $\mu$ A (typical)
    - Shutdown: 4  $\mu$ A (typical)
  - Temperature Accuracy
    - -25°C to 100°C:  $\pm 2^\circ\text{C}$  (maximum)
    - -55°C to 125°C:  $\pm 3^\circ\text{C}$  (maximum)

### 2 Applications

- General System Thermal Management
- Communications Infrastructure
- Electronic Test Equipment
- Environmental Monitoring

### 3 Description

The LM75B and LM75C are industry-standard digital temperature sensors with an integrated Sigma-Delta analog-to-digital converter and I<sup>2</sup>C interface. The LM75 provides 9-bit digital temperature readings with an accuracy of  $\pm 2^\circ\text{C}$  from -25°C to 100°C and  $\pm 3^\circ\text{C}$  over -55°C to 125°C.

Communication is accomplished over a 2-wire interface which operates up to 400kHz. The LM75 has three address pins, allowing up to eight LM75 devices to operate on the same 2-wire bus. The LM75 has a dedicated over-temperature output (O.S.) with programmable limit and hysteresis. This output has programmable fault tolerance, which allows the user to define the number of consecutive error conditions that must occur before O.S. is activated.

The wide temperature and supply range and I<sup>2</sup>C interface make the LM75 ideal for a number of applications including base stations, electronic test equipment, office electronics, personal computers, and any other system where thermal management is critical to performance. The LM75B and LM75C are available in an SOIC package or VSSOP package.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LM75B	SOIC (8)	4.90 mm x 3.91 mm
	VSSOP (8)	3.00 mm x 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

#### Typical Application

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

## 4 Revision History

Changes from Revision C (January 2015) to Revision D	Page
• Updated <i>Thermal Information</i> table.	4
• Corrected UNIT error in <i>I<sup>2</sup>C Digital Switching Characteristics</i> table.	7
• Added <i>Community Resources</i> section.	23

Changes from Revision B (March 2013) to Revision C	Page
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1

Changes from Revision A (March 2013) to Revision B	Page
• Changed layout of National Data Sheet to TI format	20

## 5 Pin Configuration and Functions

**D and DGK Packages  
8-Pin SOIC, VSSOP  
Top View**

### Pin Functions

<b>PIN</b>		<b>DESCRIPTION</b>	<b>TYPICAL CONNECTION</b>
<b>NO.</b>	<b>NAME</b>		
1	SDA	I <sup>2</sup> C Serial Bi-Directional Data Line. Open Drain.	From Controller, tied to a pullup resistor or current source
2	SCL	I <sup>2</sup> C Clock Input	From Controller, tied to a pullup resistor or current source
3	O.S.	Over temperature Shutdown. Open Drain Output	Pullup Resistor, Controller Interrupt Line
4	GND	Power Supply Ground	Ground
5	A2	User-Set I <sup>2</sup> C Address Inputs	Ground (Low, 0) or +V <sub>S</sub> (High, 1)
6	A1		
7	A0		
8	+V <sub>S</sub>	Positive Supply Voltage Input	DC Voltage from 3 V to 5.5 V; 100-nF bypass capacitor with 10-μF bulk capacitance in the near vicinity

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	<b>MIN</b>	<b>MAX</b>	<b>UNIT</b>
Supply Voltage Pin (+V <sub>S</sub> )	-0.3	6.5	V
Voltage at A0, A1and A2 Pins	-0.3	(+V <sub>S</sub> + 0.3) and must be ≤ 6.5	V
Voltage at O.S., SCL and SDA Pins	-0.3	6.5	V
Input Current at any Pin <sup>(2)</sup>		5	mA
Package Input Current <sup>(2)</sup>		20	mA
O.S. Output Sink Current		10	mA
Storage temperature, T <sub>stg</sub>	-65	150	°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its rated operating conditions.
- (2) When the input voltage (V<sub>I</sub>) at any pin exceeds the power supplies (V<sub>I</sub> < GND or V<sub>I</sub> > +V<sub>S</sub>) the current at that pin should be limited to 5 mA. The 20-mA maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of 5 mA to four.

## 6.2 ESD Ratings

			VALUE	UNIT
<b>LM75B</b>				
V <sub>(ESD)</sub>	Electrostatic discharge <sup>(1)</sup>	Human-body model (HBM)	±2500	V
		Machine model	±250	
<b>LM75C</b>				
V <sub>(ESD)</sub>	Electrostatic discharge <sup>(1)</sup>	Human-body model (HBM)	±1500	V
		Machine Model	±100	

- (1) Human body model, 100 pF discharged through a 1.5 kΩ resistor. Machine model, 200 pF discharged directly into each pin. The Charged Device Model (CDM) is a specified circuit characterizing an ESD event that occurs when a device acquires charge through some triboelectric (frictional) or electrostatic induction processes and then abruptly touches a grounded object or surface.

## 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

	MIN	MAX	UNIT
Specified Temperature Range	T <sub>MIN</sub>	T <sub>MAX</sub>	
	-55	125	°C
Supply Voltage Range (+V <sub>S</sub> ) LM75B, LM75C	3	5.5	V

- (1) Soldering process must comply with Texas Instruments Incorporated Reflow Temperature Profile specifications. Refer to  
(2) Reflow temperature profiles are different for lead-free and non-lead-free packages.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	LM75B		UNIT
	D (SOIC)	DGK (VSSOP)	
	8 PINS	8 PINS	
R <sub>θJA</sub> Junction-to-ambient thermal resistance	115.2	158.7	°C/W
R <sub>θJC(top)</sub> Junction-to-case (top) thermal resistance	62.2	52.3	°C/W
R <sub>θJB</sub> Junction-to-board thermal resistance	56.4	78.8	°C/W
Ψ <sub>JT</sub> Junction-to-top characterization parameter	10.2	5.3	°C/W
Ψ <sub>JB</sub> Junction-to-board characterization parameter	55.8	77.5	°C/W
R <sub>θJC(bot)</sub> Junction-to-case (bottom) thermal resistance	N/A	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Temperature-to-Digital Converter Characteristics

Unless otherwise noted, these specifications apply for:  $+V_S = 5$  Vdc for LM75BIM-5, LM75BIMM-5, LM75CIM-5, and LM75CIMM-5; and  $+V_S = 3.3$  Vdc for LM75BIM-3, LM75BIMM-3, LM75CIM-3, and LM75CIMM-3<sup>(1)</sup>.  $T_A = T_J = 25^\circ\text{C}$ , unless otherwise noted.<sup>(2)</sup>

PARAMETER	TEST CONDITIONS	MIN <sup>(3)</sup>	TYP <sup>(4)</sup>	MAX <sup>(3)</sup>	UNIT
Accuracy	$T_A = -25^\circ\text{C}$ to $100^\circ\text{C}$	-2	2	3	${}^\circ\text{C}$
	$T_A = -55^\circ\text{C}$ to $125^\circ\text{C}$	-3	3		
Resolution			9		Bits
Temperature Conversion Time	See <sup>(5)</sup>		100	300	ms
	See <sup>(5)</sup> , $-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$				
Quiescent Current	LM75B	I <sup>2</sup> C Inactive	0.25	0.5	mA
		I <sup>2</sup> C Inactive, $-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$			
	LM75C	Shutdown Mode, $+V_S = 3$ V	4	6	$\mu\text{A}$
		Shutdown Mode, $+V_S = 5$ V			
O.S. Output Saturation Voltage	$I_{OUT} = 4.0$ mA, $-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$			0.8	V
O.S. Delay	See <sup>(6)</sup> , $-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	1	6		Conversions
$T_{OS}$ Default Temperature	See <sup>(7)</sup>		80	75	${}^\circ\text{C}$
$T_{HYST}$ Default Temperature					

- (1) All part numbers of the LM75 will operate properly over the  $+V_S$  supply voltage range of 3 V to 5.5 V. The devices are tested and specified for rated accuracy at their nominal supply voltage. Accuracy will typically degrade  $1^\circ\text{C}/\text{V}$  of variation in  $+V_S$  as it varies from the nominal value.
- (2) For best accuracy, minimize output loading. Higher sink currents can affect sensor accuracy with internal heating. This can cause an error of  $0.64^\circ\text{C}$  at full rated sink current and saturation voltage based on junction-to-ambient thermal resistance.
- (3) Limits are specified to AOQL (Average Outgoing Quality Level).
- (4) Typicals are at  $T_A = 25^\circ\text{C}$  and represent most likely parametric norm.
- (5) The conversion-time specification is provided to indicate how often the temperature data is updated. The LM75 can be accessed at any time and reading the Temperature Register will yield result from the last temperature conversion. When the LM75 is accessed, the conversion that is in process will be interrupted and it will be restarted after the end of the communication. Accessing the LM75 continuously without waiting at least one conversion time between communications will prevent the device from updating the Temperature Register with a new temperature conversion result. Consequently, the LM75 should not be accessed continuously with a wait time of less than 300 ms.
- (6) O.S. Delay is user programmable up to 6 “over limit” conversions before O.S. is set to minimize false tripping in noisy environments.
- (7) Default values set at power up.

## 6.6 Digital DC Characteristics

Unless otherwise noted, these specifications apply for  $+V_S = 5$  Vdc for LM75BIM-5, LM75BIMM-5, LM75CIM-5, and LM75CIMM-5; and  $+V_S = 3.3$  Vdc for LM75BIM-3, LM75BIMM-3, LM75CIM-3, and LM75CIMM-3<sup>(1)</sup>.  $T_A = T_J = 25^\circ\text{C}$ , unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
$V_{IN(1)}$	Logical “1” Input Voltage	$-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	$+V_S \times 0.7$	$+V_S + 0.3$	V
$V_{IN(0)}$	Logical “0” Input Voltage	$-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	-0.3	$+V_S \times 0.3$	V
$I_{IN(1)}$	Logical “1” Input Current	$V_{IN} = +V_S$	0.005	1	$\mu\text{A}$
		$V_{IN} = +V_S$ , $-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$			
$I_{IN(0)}$	Logical “0” Input Current	$V_{IN} = 0$ V	-0.005	-1	$\mu\text{A}$
		$V_{IN} = 0$ V, $-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$			

- (1) All part numbers of the LM75 will operate properly over the  $+V_S$  supply voltage range of 3 V to 5.5 V. The devices are tested and specified for rated accuracy at their nominal supply voltage. Accuracy will typically degrade  $1^\circ\text{C}/\text{V}$  of variation in  $+V_S$  as it varies from the nominal value.
- (2) Limits are specified to AOQL (Average Outgoing Quality Level).
- (3) Typicals are at  $T_A = 25^\circ\text{C}$  and represent most likely parametric norm.

## Digital DC Characteristics (continued)

Unless otherwise noted, these specifications apply for  $+V_S = 5$  Vdc for LM75BIM-5, LM75BIMM-5, LM75CIM-5, and LM75CIMM-5; and  $+V_S = 3.3$  Vdc for LM75BIM-3, LM75BIMM-3, LM75CIM-3, and LM75CIMM-3<sup>(1)</sup>.  $T_A = T_J = 25^\circ\text{C}$ , unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
C <sub>IN</sub>	All Digital Inputs			5		pF
I <sub>OH</sub>	High Level Output Current	LM75B	V <sub>OH</sub> = 5 V, -55°C ≤ T <sub>A</sub> ≤ 125°C		10	µA
		LM75C	V <sub>OH</sub> = 5 V, -55°C ≤ T <sub>A</sub> ≤ 125°C		100	µA
V <sub>OL</sub>	Low Level Output Voltage		I <sub>OL</sub> = 3 mA, -55°C ≤ T <sub>A</sub> ≤ 125°C		0.4	V
t <sub>OF</sub>	Output Fall Time		C <sub>L</sub> = 400 pF I <sub>O</sub> = 3 mA, -55°C ≤ T <sub>A</sub> ≤ 125°C		250	ns

## 6.7 I<sup>2</sup>C Digital Switching Characteristics

Unless otherwise noted, these specifications apply for  $V_S = 5$  Vdc for LM75BIM-5, LM75BIMM-5, LM75CIM-5, and LM75CIMM-5; and  $+V_S = 3.3$  Vdc for LM75BIM-3, LM75BIMM-3, LM75CIM-3, and LM75CIMM-3,  $C_L$  (load capacitance) on output lines = 80 pF unless otherwise specified.  $T_A = T_J = 25^\circ\text{C}$ , unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN <sup>(1)(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(1)(2)</sup>	UNIT
$t_1$	SCL (Clock) Period, See <a href="#">Figure 1</a>	$-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	2.5			$\mu\text{s}$
$t_2$	Data in Set-Up Time to SCL High, See <a href="#">Figure 1</a>	$-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	100			ns
$t_3$	Data Out Stable after SCL Low, See <a href="#">Figure 1</a>	$-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	0			ns
$t_4$	SDA Low Set-Up Time to SCL Low (Start Condition), See <a href="#">Figure 1</a>	$-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	100			ns
$t_5$	SDA High Hold Time after SCL High (Stop Condition), See <a href="#">Figure 1</a>	$-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	100			ns
$t_{\text{TIMEOUT}}$	SDA Time Low for Reset of Serial Interface <sup>(4)</sup>	LM75B	$-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	75	325	ms
		LM75C			Not Applicable	

- (1) Limits are specified to AOQL (Average Outgoing Quality Level).
- (2) Timing specifications are tested at the bus input logic levels ( $V_{in}(0)=0.3xVA$  for a falling edge and  $V_{in}(1)=0.7xVA$  for a rising edge) when the SCL and SDA edge rates are similar.
- (3) Typicals are at  $T_A = 25^\circ\text{C}$  and represent most likely parametric norm.
- (4) Holding the SDA line low for a time greater than  $t_{\text{TIMEOUT}}$  will cause the LM75B to reset SDA to the IDLE state of the serial bus communication (SDA set High).

Figure 8. Accuracy vs Temperature (LM75C)

## 7 Detailed Description

### 7.1 Overview

The LM75 temperature sensor incorporates a band-gap type temperature sensor and 9-bit ADC (Sigma-Delta Analog-to-Digital Converter). The temperature data output of the LM75 is available at all times via the I<sup>2</sup>C bus. If a conversion is in progress, it will be stopped and restarted after the read. A digital comparator is also incorporated that compares a series of readings, the number of which is user-selectable, to user-programmable setpoint and hysteresis values. The comparator trips the O.S. output line, which is programmable for mode and polarity.

The LM75B contains all the functionality of the LM75C, plus two additional features:

- The LM75B has an integrated low-pass filter on both the SDA and the SCL line. These filters increase communications reliability in noisy environments.
- The LM75B also has a bus fault timeout feature. If the SDA line is held low for longer than t<sub>TIMEOUT</sub> (see [PC Digital Switching Characteristics](#)) the LM75B will reset to the IDLE state (SDA set to high impedance) and wait for a new start condition. The TIMEOUT feature is not functional in Shutdown Mode.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Digital Temperature Sensor

The LM75 is an industry-standard digital temperature sensor with an integrated Sigma-Delta analog-to-digital converter and I<sup>2</sup>C interface. The LM75 provides 9-bit digital temperature readings with an accuracy of  $\pm 2^{\circ}\text{C}$  from  $-25^{\circ}\text{C}$  to  $100^{\circ}\text{C}$  and  $\pm 3^{\circ}\text{C}$  over  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

The LM75 operates with a single supply from 2.7 V to 5.5 V. Communication is accomplished over a 2-wire interface which operates up to 400kHz. The LM75 has three address pins, allowing up to eight LM75 devices to operate on the same 2-wire bus. The LM75 has a dedicated over-temperature output (O.S.) with programmable limit and hysteresis. This output has programmable fault tolerance, which allows the user to define the number of consecutive error conditions that must occur before O.S. is activated.

## 7.4 Device Functional Modes

In Comparator mode the O.S. Output behaves like a thermostat. The output becomes active when temperature exceeds the  $T_{OS}$  limit, and leaves the active state when the temperature drops below the  $T_{HYST}$  limit. In this mode the O.S. output can be used to turn a cooling fan on, initiate an emergency system shutdown, or reduce system clock speed. Shutdown mode does not reset O.S. state in a comparator mode.

In Interrupt mode exceeding  $T_{OS}$  also makes O.S. active but O.S. will remain active indefinitely until reset by reading any register via the I<sup>2</sup>C interface. Once O.S. has been activated by crossing  $T_{OS}$ , then reset, it can be activated again only by Temperature going below  $T_{HYST}$ . Again, it will remain active indefinitely until being reset by a read. Placing the LM75 in shutdown mode also resets the O.S. Output.

The LM75B always powers up in a known state. The power up default conditions are:

1. Comparator mode
2.  $T_{OS} = 80^{\circ}\text{C}$
3.  $T_{HYST} = 75^{\circ}\text{C}$
4. O.S. active low
5. Pointer = "00"

When the supply voltage is less than about 1.7V, the LM75 is considered powered down. As the supply voltage rises above the nominal 1.7V power up threshold, the internal registers are reset to the power up default values listed above.

If the LM75 is *not connected* to the I<sup>2</sup>C bus on power up, it will act as a stand-alone thermostat with the power up default conditions listed above. It is optional, but recommended, to connect the address pins (A2, A1, A0) and the SCL and SDA pins together and to a 10k pull-up resistor to  $+V_S$  for better noise immunity. Any of these pins may also be tied high separately through a 10k pull-up resistor.

## 7.5 Programming

### 7.5.1 I<sup>2</sup>C Bus Interface

The LM75 operates as a slave on the I<sup>2</sup>C bus, so the SCL line is an input (no clock is generated by the LM75) and the SDA line is a bi-directional serial data path. According to I<sup>2</sup>C bus specifications, the LM75 has a 7-bit slave address. The four most significant bits of the slave address are hard wired inside the LM75 and are "1001". The three least significant bits of the address are assigned to pins A2–A0, and are set by connecting these pins to ground for a low, (0); or to  $+V_S$  for a high, (1).

Therefore, the complete slave address is:

1	0	0	1	A2	A1	A0
MSB						LSB

These interrupt mode resets of O.S. occur only when LM75 is read or placed in shutdown. Otherwise, O.S. would remain active indefinitely for any event.

**Figure 9. O.S. Output Temperature Response Diagram**

### 7.5.2 Temperature Data Format

Temperature data can be read from the Temperature,  $T_{OS}$  Set Point, and  $T_{HYST}$  Set Point registers; and written to the  $T_{OS}$  Set Point, and  $T_{HYST}$  Set Point registers. Temperature data is represented by a 9-bit, two's complement word with an LSB (Least Significant Bit) equal to  $0.5^{\circ}\text{C}$ :

Temperature	Digital Output	
	Binary	Hex
$125^{\circ}\text{C}$	0 1111 1010	0FAh
$25^{\circ}\text{C}$	0 0011 0010	032h
$0.5^{\circ}\text{C}$	0 0000 0001	001h
$0^{\circ}\text{C}$	0 0000 0000	000h
$-0.5^{\circ}\text{C}$	1 1111 1111	1FFh
$-25^{\circ}\text{C}$	1 1100 1110	1CEh
$-55^{\circ}\text{C}$	1 1001 0010	192h

### 7.5.3 Shutdown Mode

Shutdown mode is enabled by setting the shutdown bit in the Configuration register via the I<sup>2</sup>C bus. Shutdown mode reduces power supply current significantly. See specified quiescent current specification in the [Temperature-to-Digital Converter Characteristics](#) table. In Interrupt mode O.S. is reset if previously set and is undefined in Comparator mode during shutdown. The I<sup>2</sup>C interface remains active. Activity on the clock and data lines of the I<sup>2</sup>C bus may slightly increase shutdown mode quiescent current.  $T_{OS}$ ,  $T_{HYST}$ , and Configuration registers can be read from and written to in shutdown mode.

For the LM75B, the TIMEOUT feature is turned off in Shutdown Mode.

### 7.5.4 Fault Queue

A fault queue of up to 6 faults is provided to prevent false tripping of O.S. when the LM75 is used in noisy environments. The number of faults set in the queue must occur consecutively to set the O.S. output.

### 7.5.5 Comparator and Interrupt Mode

As indicated in the O.S. Output Temperature Response Diagram, [Figure 9](#), the events that trigger O.S. are identical for either Comparator or Interrupt mode. The most important difference is that in Interrupt mode the O.S. will remain set indefinitely once it has been set. To reset O.S. while in Interrupt mode, perform a read from any register in the LM75.

### 7.5.6 O.S. Output

The O.S. output is an open-drain output and does not have an internal pull-up. A “high” level will not be observed on this pin until pull-up current is provided from some external source, typically a pull-up resistor. Choice of resistor value depends on many system factors but, in general, the pull-up resistor should be as large as possible. This will minimize any errors due to internal heating of the LM75. The maximum resistance of the pull up, based on LM75 specification for High Level Output Current, to provide a 2V high level, is 30 kΩ.

### 7.5.7 O.S. Polarity

The O.S. output can be programmed via the configuration register to be either active low (default mode), or active high. In active low mode the O.S. output goes low when triggered exactly as shown on the O.S. Output Temperature Response Diagram, [Figure 9](#). Active high simply inverts the polarity of the O.S. output.

### 7.5.8 Internal Register Structure

**Figure 10. Internal Register Structure**

There are four data registers in the LM75B and LM75C selected by the Pointer register. At power-up the Pointer is set to “000”; the location for the Temperature Register. The Pointer register latches whatever the last location it was set to. In Interrupt Mode, a read from the LM75, or placing the device in shutdown mode, resets the O.S. output. All registers are read and write, except the Temperature register which is a read only.

A write to the LM75 will always include the address byte and the Pointer byte. A write to the Configuration register requires one data byte, and the  $T_{OS}$  and  $T_{HYST}$  registers require two data bytes.

Reading the LM75 can take place either of two ways: If the location latched in the Pointer is correct (most of the time it is expected that the Pointer will point to the Temperature register because it will be the data most frequently read from the LM75), then the read can simply consist of an address byte, followed by retrieving the corresponding number of data bytes. If the Pointer needs to be set, then an address byte, pointer byte, repeat start, and another address byte will accomplish a read.

The first data byte is the most significant byte with most significant bit first, permitting only as much data as necessary to be read to determine temperature condition. For instance, if the first four bits of the temperature data indicates an overtemperature condition, the host processor could immediately take action to remedy the excessive temperatures. At the end of a read, the LM75 can accept either Acknowledge or No Acknowledge from the Master (No Acknowledge is typically used as a signal for the slave that the Master has read its last byte).

An inadvertent 8-bit read from a 16-bit register, with the D7 bit low, can cause the LM75 to stop in a state where the SDA line is held low as shown in [Figure 11](#). This can prevent any further bus communication until at least 9 additional clock cycles have occurred. Alternatively, the master can issue clock cycles until SDA goes high, at which time issuing a “Stop” condition will reset the LM75.

**Figure 11. Inadvertent 8-Bit Read from 16-Bit Register where D7 is Zero (“0”)**

## 7.6 Register Maps

### 7.6.1 Pointer Register (Selects Which Registers Will Be Read From or Written to):

P7	P6	P5	P4	P3	P2	P1	P0
0	0	0	0	0		Register Select	

P0-P1: Register Select:

P2	P1	P0	Register
0	0	0	Temperature (Read only) (Power-up default)
0	0	1	Configuration (Read/Write)
0	1	0	T <sub>HYST</sub> (Read/Write)
0	1	1	T <sub>OS</sub> (Read/Write)

P3–P7: Must be kept zero.

### 7.6.2 Temperature Register (Read Only):

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
MSB	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	LSB	X	X	X	X	X	X	X

D0–D6: Undefined. D7–D15: Temperature Data. One LSB = 0.5°C. Two's complement format.

### 7.6.3 Configuration Register (Read/Write):

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	Fault Queue	O.S. Polarity	Cmp/Int	Shutdown	

Power up default is with all bits “0” (zero).

D0: Shutdown: When set to 1 the LM75 goes to low power shutdown mode.

D1: Comparator/Interrupt mode: 0 is Comparator mode, 1 is Interrupt mode.

D2: O.S. Polarity: 0 is active low, 1 is active high. O.S. is an open-drain output under all conditions.

D3–D4: Fault Queue: Number of faults necessary to detect before setting O.S. output to avoid false tripping due to noise. Faults are determined at the end of a conversion. See specified temperature conversion time in the [Temperature-to-Digital Converter Characteristics](#) table.

D4	D3	Number of Faults
0	0	1 (Power-up default)
0	1	2
1	0	4

D4	D3	Number of Faults
1	1	6

D5–D7: These bits are used for production testing and must be kept zero for normal operation.

#### 7.6.4 $T_{HYST}$ and $T_{OS}$ Register (Read/Write):

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
MSB	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	LSB	X	X	X	X	X	X	X

D0–D6: Undefined

D7–D15:  $T_{HYST}$  Or  $T_{OS}$  Trip Temperature Data. Power up default is  $T_{OS} = 80^\circ\text{C}$ ,  $T_{HYST} = 75^\circ\text{C}$

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The wide temperature and supply range and I<sup>2</sup>C interface make the LM75 ideal for a number of applications including base stations, electronic test equipment, office electronics, personal computers, and any other system where thermal management is critical to performance.

### 8.2 Typical Application

#### 8.2.1 Simple Fan Controller, Interface Optional

When using the two-wire interface: program O.S. for active high and connect O.S. directly to Q2's gate.

**Figure 12. Simple Fan Controller, Interface Optional**

##### 8.2.1.1 Design Requirements

The LM75 requires a positive supply voltage of 2.7 V to 5.5 V to be applied between +Vs and GND. For best results, bypass capacitors of 100 nF and 10 µF are recommended. Pull-up resistors of 10 kΩ are required on SCL and SDA.

##### 8.2.1.2 Detailed Design Procedure

Accessing the conversion result of the LM75 consists of writing an address byte followed by retrieving the corresponding number of data bytes. The first data byte is the most significant byte with the most significant bit first, permitting only as much data as necessary to be read to determine temperature condition. For instance, if the first four bits of the temperature data indicates an overtemperature condition, the host processor could immediately take action to remedy the excessive temperatures. At the end of a read, the LM75 can accept either Acknowledge or No Acknowledge from the Master (No Acknowledge is typically used as a signal for the slave that the Master has read its last byte). Temperature data is two's complement format and one LSB is equivalent to 0.5°C.

## Typical Application (continued)

### 8.2.1.3 Application Curve

**Figure 13. Temperature Accuracy**

## 8.3 System Examples

### 8.3.1 Simple Thermostat, Interface Optional

**Figure 14. Simple Thermostat, Interface Optional**

## System Examples (continued)

### 8.3.2 Temperature Sensor with Loudmouth Alarm (Barking Watchdog)

Figure 15. Temperature Sensor with Loudmouth Alarm (Barking Watchdog)

## 9 Power Supply Recommendations

The LM75 is specified for operation from 2.7 V to 5.5 V. Place a 100-nF and 10- $\mu$ F capacitor close to +Vs in order to reduce errors coupling in from noisy or high impedance supplies.

## 10 Layout

### 10.1 Layout Guidelines

To achieve the expected results when measuring temperature with an integrated circuit temperature sensor like the LM75, it is important to understand that the sensor measures its own die temperature. For the LM75, the best thermal path between the die and the outside world is through the LM75's pins. In the VSSOP package for the LM75B and LM75C, the GND pin is directly connected to the die, so the GND pin provides the best thermal path. If the other pins are at different temperatures (unlikely, but possible), they will affect the die temperature, but not as strongly as the GND pin. In the SOIC package, none of the pins is directly connected to the die, so they will all contribute similarly to the die temperature. Because the pins represent a good thermal path to the LM75 die, the LM75 will provide an accurate measurement of the temperature of the printed circuit board on which it is mounted. There is a less efficient thermal path between the plastic package and the LM75 die. If the ambient air temperature is significantly different from the printed circuit board temperature, it will have a small effect on the measured temperature.

In probe-type applications, the LM75 can be mounted inside a sealed-end metal tube, and can then be dipped into a bath or screwed into a threaded hole in a tank. As with any IC, the LM75 and accompanying wiring and circuits must be kept insulated and dry, to avoid leakage and corrosion. This is especially true if the circuit may operate at cold temperatures where condensation can occur. Printed-circuit coatings and varnishes such as Humiseal and epoxy paints or dips are often used to insure that moisture cannot corrode the LM75 or its connections.

#### 10.1.1 Digital Noise Issues

The LM75B features an integrated low-pass filter on both the SCL and the SDA digital lines to mitigate the effects of bus noise. Although this filtering makes the LM75B communication robust in noisy environments, good layout practices are always recommended. Minimize noise coupling by keeping digital traces away from switching power supplies. Also, ensure that digital lines containing high-speed data communications cross at right angles to the SDA and SCL lines.

Excessive noise coupling into the SDA and SCL lines on the LM75C—specifically noise with amplitude greater than 400 mV<sub>pp</sub> (the LM75's typical hysteresis), overshoot greater than 300 mV above +V<sub>s</sub>, and undershoot more than 300 mV below GND—may prevent successful serial communication with the LM75C. Serial bus no-acknowledge is the most common symptom, causing unnecessary traffic on the bus. The layout procedures mentioned above apply also to the LM75C. Although the serial bus maximum frequency of communication is only 400 kHz, care must be taken to ensure proper termination within a system with long printed circuit board traces or multiple parts on the bus. Resistance can be added in series with the SDA and SCL lines to further help filter noise and ringing. A 5 k $\Omega$  resistor should be placed in series with the SCL line, placed as close as possible to the SCL pin on the LM75C. This 5 k $\Omega$  resistor, with the 5 pF to 10 pF stray capacitance of the LM75 provides a 6 MHz to 12 MHz low pass filter, which is sufficient filtering in most cases.

## 10.2 Layout Example

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

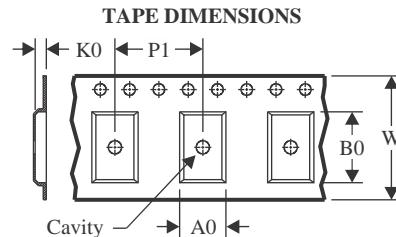

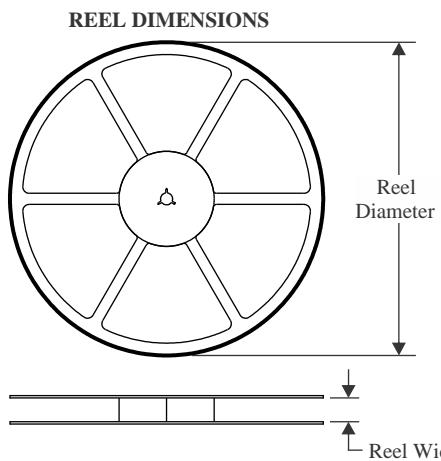

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

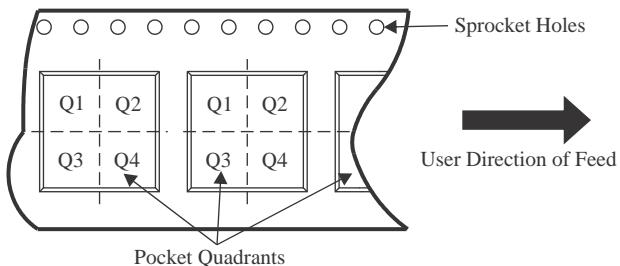

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
